

**SYSTEM FOR CONVERTING HARDWARE DESIGNS IN HIGH-LEVEL  
PROGRAMMING LANGUAGES TO HARDWARE IMPLEMENTATIONS**

**Abstract of the Disclosure**

A computer aided hardware design system for enabling design of an actual  
5 hardware implementation for a digital circuit using a high-level algorithmic programming  
language. The system converts an algorithmic representation for a hardware design  
initially created in the high-level programming language, such as ANSI C, to a hardware  
design implementation, such as an FPGA or other programmable logic or an ASIC. The  
C-type program representative of the hardware design is compiled into a register transfer  
10 level (RTL) hardware description language (HDL) that can be synthesized into a gate-  
level hardware representation. The system additionally enables simulation of the HDL  
design to verify design functionality. Finally, various physical design tools can be utilized  
to produce an actual hardware implementation. The system also permits the use of other  
non-C-type high-level programming languages by first translating to a C-type program. In  
15 contrast to previous hardware design tools, the system compiles all C-type programming  
language features, including pointers and structures, into synthesizable HDL.
